HOW THE ERIX TOOL OPERATES

SPOTFACING • CHAMFERING • COUNTERBORING • DEBURRING

TECHNICAL DESCRIPTION

Patented Design. Reliable Performance. The Erix tool is an automatic back spotfacing or back chamfering tool consisting of a spindle and a cutter, called a wing, which folds into the spindle recess when the tool enters the hole in the workpiece. Excellent performance is ensured because there is only one moving part.

Save time and money. Working time saved when compared with conventional methods is normally between 60% and 70%, in some cases more than 90%.

SPINDLE.

The pilot part of the spindle guides the spotfacer into the hole and takes up the cutting forces. The pilot diameter is less than the nominal hole diameter.

The difference in diameter is as follows:

Hole dia.	Difference
.188 – .375"	.002"
.406 – .500"	.004"
.531 – .969"	.008"
1.000 – 1.156"	.012"
above 1.181"	.012"

Spindles above size 1.181" have a pilot diameter which is .039" less than the hole diameter. These spindles are provided with wear strips, which guide the spotfacer into the hole. All spindles have cylindrical shanks.

COOLANT THROUGH

All spindles with cylindrical shanks, for hole size .394" and above, have coolant through.

WING

During operation the wing must be free to swing. Therefore, when assembling a wing, **the pivot screw should be released about 30 degrees**, before tightening the locking screw.

Smaller wings are made of HSS with integral cutting edge. Larger size wings have square inserts type ISO SPUN or rectangular inserts type ISO/R242.

The inserts are clamped to the wings by means of Secodex **lefthand** threaded screws.

How to use the tables

1. Enter the table to the left with the correct workpiece material and the relevant wing type (HSS or Carbide) and obtain Number and Letter Code.
Example: Suppose workpiece material is Plain Carbon steel to be cut with a wing fitted with a carbide insert. You will find the Code: 50D.

2. With this code you go to the two tables below, using also the Spotfacing or Chamfering diameter (*Please note! Not hole diameter*).
To the left, using Letter Code, you will find Feed in inch/REV, and to the right, using Number Code, you find Speed in RPM.
Example: Suppose you are going to operate our tool 90-25.4/45.4-CS20. With a Spotfacing diameter of 1.787" (45.4 mm) and the above Code 50D you will find:
Feed: .0055" / REV
Speed: 338 RPM
This would give a feed rate of: 338 x .0055 = 1.859"/min.

Spot-facing/ Chamfering diameter in inch	Feed in inch / REV						Speed in REV / min												
	Letter Code						Number Code - Speed (m/min)												
	A	B	C	D	E	F	5	10	15	20	25	30	35	40	45	50	60	70	80

DIRECTIONS FOR USE of ERIX Spot Facers

BEFORE USING THE TOOL MAKE THE FOLLOWING CHECKS:

TOOL

- Check that the wing is free to swing. To prevent tightening of the wing caused by heat expansion, the **pivot screw** should have been **released about 30 degrees**.
- Spot Facers above size 1.181" have wings provided with a guide tang to keep the wing in a working position even at low speeds and in horizontal position. It is of **utmost importance** to check that the **entire length** of wing **including the guide tang** will **have space** enough within the workpiece to swing free before cutting operation starts. If this is not the case damage to wing and spindle will be caused.
- Check insert quality. **Use ISO K20 for cast iron** and **ISO P40 for steel**. ERIX Spot Facers are normally fitted with insert of grade ISO K20. When changing inserts note that the **clamping screw is lefthand threaded**.

TOOL HOLDER

Thoroughly fasten tool or tool holder with tool into the machine spindle.

WORKPIECE

Since the hole acts as a guiding surface for the Spot Facer, **a few drops of thin oil** in the hole **should be used**. When machining in steel coolant should be used.

OPERATION

Choose machine spindle **speed according to table**.

Start the machine spindle **counter-clockwise** (looking away from machine headstock) and **feed** the Spot Facer **rapidly up to the hole**. Since the wing must make contact with the workpiece in order to properly close, the **feedrate should be reduced to maximum .008"/rev. when entering** the hole. The wing will remain folded in, while passing through the hole and will swing out again by centrifugal force after having passed through. **Make sure that the entire length of the wing including the guide tang swings free of workpiece before reversing to clockwise rotation**. Then **apply feed according to table**.

IMPORTANT! The wing closes through contact with the workpiece, not through the centrifugal force.

After spot-facing, rapid traverse the wing away from the spotfaced surface. **If the wing has a guide tang the traverse must also clear the guide tang**.

Now reverse the spindle rotation and **back feed rapidly** until wing (or guide tang) is **near the spot faced surface**. Then the **feedrate should be reduced** again to **maximum .008"/rev.** until the wing is completely closed. The tool may then be withdrawn from the hole in rapid traverse.

IMPORTANT! When cutting in a fillet (interrupted cut), with a horizontal spindle 1.181" or less, **speed should be increased up to 2 times figures given in table. Feed to be reduced by 20-30%.**

A FEW HINTS FOR SMOOTH OPERATION

- Small wings of type HSS might be magnetized during the operation. Demagnetize them if necessary.
- Use coolant. For cast iron use a few drops of thin, non-sticky oil.
- Tolerance on spotfacing diameter is approximately:

Hole dia.	Tolerance
.188 – .375"	± .004"
.406 – 1.156"	± .008"
1.188 – 2.688"	± .012"
- To improve the surface finish on the spotfaced surface, reduce the speed and feed at the end of the operation and let the tool dwell for a few seconds.
- To avoid marks in the finished hole, proceed as follows: drill the hole undersize, back spot face, ream the hole to finished size.
- Always check that the support for workpiece is strong enough to avoid any form of vibration.
- Use "coolant through" whenever possible. It has several advantages: chips break, chips are removed, keeps spindle and wing cool, prevents workpiece surface from hardening. If "coolant through" is not available we then recommend that plenty of coolant be applied as close to the cutting operation as possible.
- Ensure that screws are correctly tightened:
 - the pivot-screw, after having been slightly tightened, should be released about 30 degrees and then secured by the locking screw and its brass seat.
 - the Secodex clamping screw in the wing is lefthand threaded. When tightening this screw the insert will be secured firmly into the pocket made specially for this purpose in the wing. Furthermore the Secodex-screw has the form of an umbrella with a rim acting like a spring pressing hard and holding the insert. So don't forget to tighten this screw!
 - remaining screws. Check that they are tightened.
- Keep the cutting edge sharp, (except when operating in hard aluminium). Regrind cutting edge or change insert frequently.
- Ensure that there is space enough for the wing to swing out freely before, during or after the cutting operation.
- The Erix tool is not designed to cut in a radial direction. If you try to use the tool as a reamer, the wing and/or spindle will break.
- Ensure that the hole in the workpiece has a +tolerance (i.e. is larger than the nominal diameter), as for instance +.005", - 0.
A drill that produces a -tolerance (smaller than nominal) should not be used.

WINGS WITH GUIDE TANG

Large spotfacing tools run at low speed. When operating in a horizontal position the centrifugal force acting on the wing is insufficient to hold the wing in correct working position. Therefore, spotfacing tools above 1.181" diameter have wings provided with a guide tang.

- When cutting in a fillet the guide tang must enter the hole before the tip of insert cuts the fillet.
- When the guide tang enters the hole it will keep the wing in its working position.
- After spotfacing, the spindle must be retracted until the guide tang is free from the hole before the spindle can be reversed.

IMPORTANT!

When cutting in a fillet (interrupted cut) with a horizontal spindle increase speed up to 2 times figures given in table and reduce feed by 20–30% (spindles .177-1.181" diameter only).

When operating the tools for hole size above 1.181" see instructions above.

WINGS TYPE HSS ES

When operating conditions are too severe for the ordinary HSS wing the use of the EXTRA STRONG HSS wing is recommended. Such a wing is coded with the suffix ES; e.g. 37-037 ES.

WINGS TYPE HSS BI

Spotfacing wings size 020 and 030, normally made of HSS, can be supplied with BRAZED INSERTS grade K20 (or grade P40 for steel). Such a wing is coded with the suffix BI; e.g. 37-037 BI.

WINGS WITH CENTERLOCK INSERTS

Heavy cutting loads in tough material such as stainless or high alloy steel make stringent demands on the clamping system. To comply with such demands, wings of size 060 or larger, which are normally fitted with square SPUN inserts, can be supplied with centerlocked inserts type SPMA. These wings are coded 38- instead of 37-; e.g. 38-120-2070.

SPECIAL HINTS FOR OPERATION IN SOME DIFFICULT MATERIALS

WORKPIECE MATERIAL

Steel: It can be a little difficult with soft steel to choose the best speed and feed. If speed is too high, vibrations might occur; if too low, material might build up on the cutting edge.

If there is a weld within the area to be spot faced and especially if there is also an interrupted cut, you might experience difficulties due to local high-hardness spots.

Stainless steel: Operating in stainless steel can cause problems similar to those described above.

Cast iron: The surface is often very hard and sometimes you will find grains of sand included in the surface. The cutting edge will quickly become blunt, which can cause the wing to break.

Titanium: Titanium is a very special material. When you have got experience, however, you should not expect difficulties.

Aluminum: Soft aluminum will give long chips.

Hard aluminum will give short chips.

RECOMMENDATIONS

Deviate from recommended figures up and down to find best result.

HSS-wings should - if possible - have brazed inserts, quality P40, (type BI). Larger wings can either have inserts with a centerlock screw (type 38-) (See page 7) or on special request be fitted with brazed inserts (quality P40).

Follow above recommendations. If they are not sufficient, ask us for chip breakers to be ground at the cutting edge of the wing or the insert. To further relieve the stress on the wing it can under certain circumstances be advisable to make the spotface in two diameter-steps.

When using HSS-wings try type BI with brazed inserts quality K20 or, when they are not available, type ES (See page 7). For larger wings use inserts quality K20.

Insert quality P40 is generally recommended. For smaller wings use brazed inserts P40, where available. Otherwise wings type ES. Larger wings should have ordinary inserts P40. If necessary ask for special wings with brazed inserts.

If necessary arrange chip breaker. (See under stainless steel above).

Ask us to supply wings or inserts with a chipping angle reduced from 7,5 degrees (which is our standard) to 0 degrees. It can also be useful to hone the cutting edge to obtain a small (approx .004") negative chipping angle.

PART NUMBERING SYSTEM

Complete tool is coded 90-25.4/45.4-CS19.1

Prefix 90- = back spotfacing 90°

25.4 = hole diameter in mm

45.4 = facing diameter in mm

CS = cylindrical shank

19.1 = shank diameter in mm

Spindle is coded 27-25.4-CS19.1

Prefix 27- = spindle, standard or semistandard

25.4 = hole diameter in mm

CS = cylindrical shank

19.1 = shank diameter in mm

Important! To front- and Backspotface with Spindle above 1.181". Please see page 22 and 23.

Wing is coded 37-111 (standard) or

37-110-1450 (semistandard)

Prefix 37- = wing for back spotfacing 90°

Wings with Centerlock Inserts

Type	Inserts - Type (K 20 or P40*)
38-061	SPMA 080312
38-062	SPMA 090308
38-063	SPMA 090308
38-091	SPMA 120308
38-101	SPMA 090308
38-102	SPMA 090308
38-111	SPMA 120308
38-121	SPMA 150408
38-131	SPMA 150408
38-132	SPMA 190412
38-141	SPMA 150408
38-142	SPMA 190412

Other prefixes:

45- = chamfering 45°

60- = chamfering 60°

30- = chamfering 30°

902- = front and back spotfacing

452- = front and back chamfering 45°

29- = special tool

Other prefix:

29- = special spindle

Other prefixes:

34- = back chamfering

35- = front and back chamfering

36- = front and back spotfacing

38- = back spotfacing 90° with centerlock screw

39- = special wing

Other types – Please request!

* K20 delivered as standard.

SEMISTANDARD AND SPECIAL TOOLS

In addition to the tools listed in this Catalog we manufacture semistandard and special spindles and wings for ...

1. Hole sizes up to 8.000" in diameter.
2. Holes with diameters between those listed at intervals of .004" (.002" for hole size .188 - .375").
3. Back spotfacing and Front/Back spotfacing at intervals of .004" in facing diameter.
4. Chamfering angles other than 45°, 60° and 30°. Minimum angle is 15°.
5. Special shanks.

When requesting a quotation for a non-standard tool, please supply the following information ...

- a) Hole diameter to the nearest .004" (or .002" for hole size .188 - .375").
- b) Facing diameter to the nearest .004".
- c) Operation – back spotfacing/chamfering or front and back spotfacing/chamfering.
- d) Chamfering angle α .
- e) Type of shank.
- f) Grade of carbide insert i.e. K20 for cast iron or P40 for steel.

For very special or unusual applications please send a dimensioned sketch of the workpiece.

Possibilities for Erix Tool

Front spot facing and back spot facing

Front spot facing and back chamfering

Back chamfering with radius

Front spot facing with dual diameters

BACK SPOTFACING

COMBINATION TABLE

In this table are listed all combinations, to do various spotfaces, which are possible with spindles and backspotfacing wings listed in the metric and inch catalogues.

Spindles are specified by hole diameter and listed along the top of each table horizontally. Wings are specified by part number and located vertically along the lefthand margin of the table. The spotfacing diameters these spindles and wings will produce are located in the several columns located below the hole diameters and to the right of the wing part numbers. These spotfacing diameters are given in inch.

To locate a particular combination, first select a hole dimension from those listed at the top of the chart. Second, follow the column of numbers below the hole dimension until you locate the required spotface diameter. Third, move to the left until you find a wing part number. This is the wing that is required for the spotface diameter selected.

The spindle used for the hole selected can be found in either the metric or inch catalogues, under hole diameter.

On page 27 all Cutters/Inserts (C) are specified.

FOR OPERATIONS IN YOUR NC/CNC MACHINE

ERIX TOOL

90-33.3/63-CS31.8

L3 = 2.283"

L4 = 1.969"

L6 = .827"

H = 4.0"

J = 2.75"

ST = .315"

SA = .2" (security distance)

MACHINE TIME

Workpiece: Flange according to drawing below

Material: Cast steel

Numbers of Components: 100

Numbers of Operation: 1200

Step	Z-Length	Feed inch/min	Time
B1	$H + L6 - SA = 4.627$	70.00	3,5
B2	$SA + SA = .4$	2.56	9,2
B3	$J + (L3 - L6) = 1.294$	70.00	3,2
B4	$SA + .16 = .36$	2.56	8,3
B5	$(L3 - L4) - .16 + ST = .469$	2.30	12,4
B6	Rotation	-	3
B7	$(L3 - L4) + .04 = .354$	2.56	8,3
B8	$.04 + SA = .24$	2.56	5,6
B9	$J - ST - SA + (L3 - L4) + H + L4 = 8.518$	70.00	6,5
Tot. time			60,0

RESULT

By using the Erix Tool in this case...

Costs were reduced by 3 600 USD

or

60 hours were saved, which can be used for the machining of other components.

COST ANALYSIS

Tool:	Conventional HSS-Tool with manual cutter change	ERIX Tool 90-33.3/63-CS31.8
Cutter:	HSS	Carbide inserts
Cutting Speed:	1.00"/min	2.00"/min
Machining time:	4,0 min	1,0 min
Man and Machine costs:	60 USD/hour	60 USD/hour
Costs per spotfacing:	4 USD	1 USD
Total cost:	4800 USD	1200 USD

PROGRAMMING INSTRUCTIONS ON NEXT PAGE

ERIX-Tools up to Spindle 1.181" (without guide tang)

1. Program - Step A1

Counter-clockwise rotation at recommended speed: rapid feed until the wing is a few thousandths, security distance (SA), from the workpiece.

Rotation	: Counter-clockwise	S
Speed	: RPM	F
Feed	: Rapid	inch
Formula for Z	: $H + L6 - SA$	Z+
Stop at Z+	: $(L4 - L6) + SA$	

3. Program - Step A3

Counter-clockwise rotation: rapid feed forward until the entire length of the wing swings completely free.

Rotation	: Counter-clockwise	F
Feed	: Rapid	inch
Formula for Z	: $J + (L4 - L6)$	Z-
Stop at Z-	: $-(J + SA)$	

5. Program - Step A5

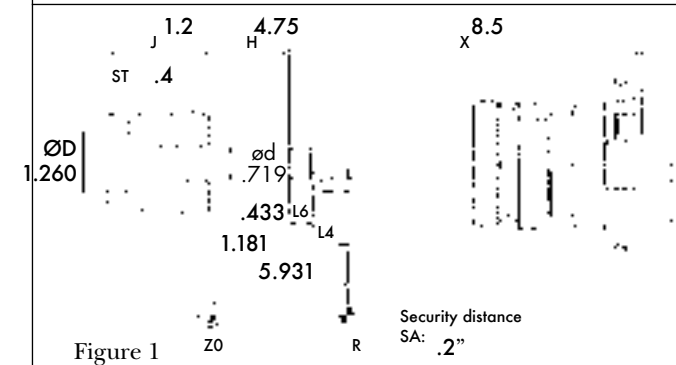

Stop feeding and let the tool dwell for 5 seconds.

6. Program - Step A6

After spotfacing back the tool away until the wing swings completely free. Reverse again to counter-clockwise rotation.

Rotation	: Clockwise	F
Feed	: Rapid	inch
Distance for Z	: .04"	Z-
Stop at Z-	: $-(J - ST + .04)$	

2. Program - Step A2

Counter-clockwise rotation: feedrate reduced to .008" per rev. until the wing has folded into the spindle recess.

Rotation	: Counter-clockwise	F
Feed	: .008/rev	inch
Feed/min	: Feed x Speed	Z+
Formula for Z	: $SA + SA$	
Stop at Z+	: $(L4 - L6) - SA$	

4. Program - Step A4

Reverse to clockwise rotation: cutting operation with feedrate according to recommendations.

Rotation	: Clockwise	F
Feed according to table	: Feed x Speed	inch/rev
Feed/min	: Feed x Speed	F
Formula for Z	: $SA + ST$	inch
Stop at Z-	: $-(J - ST)$	Z-

7 Program - Step A7

Counter-clockwise rotation: reduce feedrate to .008" per rev. until the wing has folded into the spindle recess.

Rotation	: Counter-clockwise	F
Feed	: .008/rev	inch
Feed/min	: Feed x Speed	Z-
Formula for Z	: $.04 + SA$	
Stop at Z-	: $-(J - ST - SA)$	

8. Program - Step A8

Rapid feed back to the starting point R.

Feed	: Rapid	F
Formula for Z	: $J - ST - SA + H + L4$	inch
Stop at Z+	: Reference point - R	Z+

Step	Formula for Z	Z inch	Stop at Z	Speed RPM	Rotation	Feed
A1	$H + L6 - SA$	4.983	.948	320	Counter-clockwise	70.00
A2	$SA + SA$.4	.541	320	Counter-clockwise	2.56
A3	$J + (L4 - L6)$	1.948	- 1.400	320	Counter-clockwise	70.00
A4	$SA + ST$.6	-.800	320	Clockwise	2.02
A5	Rotation	0	-.800	320	Clockwise	stop
A6	.040"	.04	-.840	320	Clockwise	24.00
A7	$.040 + SA$.24	-.600	320	Counter-clockwise	2.56
A8	$J - ST - SA + H + L4$	6.531	5.931	320	Counter-clockwise	70.00

ERIX-Tools – Spindle, over 1.181” (with guide tang)

Set workpiece 0-Point and Tool reference point R (Please see figure 1, page 29).

1. Program - Step B1

Counter-clockwise rotation at recommended speed: rapid feed until the wing is a few thousandths, security distance (SA), from the workpiece.

Rotation : Counter-clockwise
 Speed : RPM S
 Feed : Rapid F
 Formula for Z : H + L6 - SA inch
 Stop at Z+ : (L4 - L6) + SA Z+

3. Program - Step B3

Counter-clockwise rotation: rapid feed forward until the entire length of the wing swings completely free.

Rotation : Counter-clockwise
 Feed : Rapid F
 Formula for Z : J + (L3 - L6) inch
 Stop at Z- : - (J + (L3-L4) + SA) Z-

5. Program - Step B5

Reverse to clockwise rotation: cutting operation with feedrate according to recommendations.

Rotation : Clockwise
 Feed according to table : mm/rev
 Feed/min : Feed x Speed F
 Formula for Z : (L3-L4) - .16 + ST inch
 Stop at Z- : - (J - ST) Z-

8. Program - Step B8

Counter-clockwise rotation: reduce feedrate .008” per rev. until the wing has folded into the spindle recess. The guide tang will close the wing.

Rotation : Counter-clockwise
 Feed : max. .008/rev
 Feed/min : Feed x Speed F
 Formula for Z : .04 + SA inch
 Stop at Z- : - (J - ST + (L3-L4) - SA) Z-

2. Program - Step B2

Counter-clockwise rotation: feedrate reduced to .008” per rev. until the wing has folded into the spindle recess.

Rotation : Counter-clockwise
 Feed : .008/rev
 Feed/min : Feed x Speed F
 Formula for Z : SA + SA inch
 Stop at Z+ : (L4 - L6) - SA Z+

4. Program - Step B4

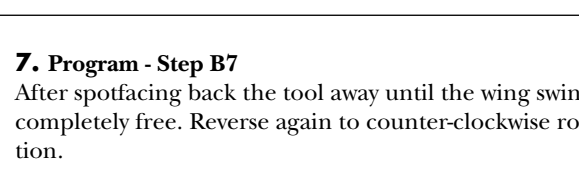

The guide tang enters the hole and will keep the wing in its working position.

Rotation : Clockwise
 Feed : max. .008/rev
 Feed/min : Feed x Speed
 Formula for Z : SA + .16 inch
 Stop at Z- : - (J + (L3-L4) - .16) Z-

6. Program - Step B6

Stop feeding and let the tool dwell for 5 seconds.

7. Program - Step B7

After spotfacing back the tool away until the wing swings completely free. Reverse again to counter-clockwise rotation.

Rotation : Clockwise
 Feed : Rapid F
 Formula for Z : (L3 - L4) + .04 inch
 Stop at Z- : - (J - ST + (L3-L4) + .04) Z-

9. Program - Step B9

Rapid feed back to the starting point R.

Rotation : Counter-clockwise
 Feed : Rapid F
 Formula for Z : J - ST - SA + (L3 - L4) + H + L4 inch
 Stop at Z+ : Reference point R Z+

SPARE PARTS

HOLE SIZE .188–1.156”

SPINDLE

Hole dia ø	Pivot screw	Allen wrench	Locking screw	Allen wrench	Brass seat ø

The Erix Automatic Back Spotfacer was invented in the early 70's by an employee at Eriksbergs Mekaniska Verkstad in Gothenburg – one of the most famous shipyards in the world at that time.

Huge diesel engines for ship propulsion were manufactured in the machine shop. Several parts needed back spotfacing, which was difficult and time consuming using traditional methods. This new back spotfacing tool substantially improved the operation.

The production and marketing of this tool was handed over to a newly founded separate company in 1977. The name – with reference and reverence to the shipyard – was ERIX TOOL AB.

Since this time the automatic back spotfacer is sold worldwide. More than 30 representatives in most industrialized countries distribute the tool to manufacturers of very different kinds of products – from tiny camera parts to large nuclear powered machinery.

Other examples include: engines, turbines, pumps, valves, printing machines, road building machinery, farming equipment and both hand-operated and numerically controlled machine tools, just to mention some.

Sooner or later nearly every metal working industry will find the use of the Erix Automatic Back Spotfacer as an ideal solution. Whether it is a simple or a complicated operation, whether using a small hand-operated machine, or an enormous machine tool equipped for untended production, or even an automatic multi-spindle set-up the Erix Automatic Back Spotfacer will save you time and money.

ERIX TOOL AB, Gamla Tuvevagen 15 C, SE-417 05 Gothenburg, Sweden
